

IILM University

Internship Topic/Title :	Working as a Software Engineer at a Start Up Job Simulation
Student Name :	Apurv Narayan Bajpai
Enrollment Number :	25SCS1003004855
Program &Semester :	B.tech(CSE) , 3rd
Orgnisation :	Forage (Y Combinator)

Description:

I have completed Y Combinator's Working as a Software Engineer at a Start Up Job Simulation on Forage. In the simulation I:

- * Built and extended a Kanban-style task management system for a logistics startup, enabling drag-and-drop task reordering and status transitions across workflow stages.
- * Integrated a Node.js backend to persist task status and priority changes, ensuring workflow state remained consistent across user sessions.
- * Analyzed product usage data with SQL to measure daily active users and task activity, and proposed data-driven feature ideas to improve engagement.
- * Applied product thinking by translating user behavior, support feedback, and metrics into actionable feature hypotheses and recommendations.
- * Gained experience working across frontend, backend, analytics, and product strategy in a startup-style environment.

Y Combinator Working as a Software Engineer at a Start Up Job Simulation on Forage

August 27, 2026

- * Built and extended a Kanban-style task management system for a logistics startup, enabling drag-and-drop task reordering and status transitions across workflow stages.
- * Integrated a Node.js backend to persist task status and priority changes, ensuring workflow state remained consistent across user sessions.
- * Analyzed product usage data with SQL to measure daily active users and task activity, and proposed data-driven feature ideas to improve engagement.
- * Applied product thinking by translating user behavior, support feedback, and metrics into actionable feature hypotheses and recommendations.
- * Gained experience working across frontend, backend, analytics, and product strategy in a startup-style environment.

Overview :

I recently participated in Y Combinator's job simulation on the Forage platform, and it was incredibly useful to understand what it might be like to participate on a product-focused engineering team at a fictional company like Shiptivitas.

I worked on a project to design, implement, and evaluate a Kanban-based productivity feature for freight shippers. I practiced using React, Node.js, SQL, and drag-and-drop UI libraries and built my full-stack development and product thinking skills in a real-world context.

Doing this program confirmed that I really enjoy working on workflow optimization and data-informed product improvements, and I'm excited to apply these skills on a product or software engineering team at a company like Shiptivitas
